

Wagr

Social micro-prediction markets for everyday questions among friends

The Problem & Our Solution

Casual betting among friends is everywhere, but settling it fairly is messy and trust-dependent.

- Friends make side bets on sports, trivia, and local events all the time
- No neutral party to hold stakes or confirm who actually won
- Subjective or ambiguous outcomes cause arguments and awkwardness
- Wagr turns any friendly bet into a transparent, time-boxed prediction pool on Solana
- Funds are escrowed and paid out automatically by smart contract, no bookmaker needed

How It Works

Create a pool, stake together, resolve fairly, get paid automatically — all in under a minute.

- User flow: create market with stake + deadline, share link or Discord post, friends stake SOL/SPL
- Group votes on outcome, or a Switchboard oracle resolves objective events like scores/prices
- Architecture: Next.js frontend, Anchor/Rust program on Solana, Phantom wallet adapter
- On-chain: stakes held in escrow PDA, resolution recorded, smart contract auto-distributes winnings
- Discord bot API lets groups spin up markets directly inside their chat

Built with

Solana, Anchor, Rust, Switchboard oracle, Next.js, Discord bot API, Phantom wallet adapter

Why Now & What's Next

Social, low-stakes crypto apps are gaining traction, and Solana makes instant tiny markets practical.

- Solana's speed and low fees make sub-dollar, instant-settlement markets actually usable
- Consumer appetite for fun, social crypto experiences is rising beyond pure trading
- Next: native Discord/Telegram bot for in-chat market creation
- Next: more oracle integrations to support broader market categories
- Next: token-gated private groups and recurring prediction leagues
